News from LightLab Sweden

New website to answer new needs

There is a lot happening at LightLab right now. The COVID-19 has fundamentally changed the world as we know it and more and more people are becoming aware of the importance of proper disinfection. LightLab's new PureFize[®] UV disinfection technology has been developed to answer that growing need. With impressive results from bacteria tests and development kits ready to ship it is high time to throw open the gates!

New times, new needs and a new website. With more and more consumers changing their personal habits such as cleaning surfaces, the demand for efficient disinfection is constantly growing. Take a look at our new website to learn more about our technology and read the latest news.

Effective and easy to integrate

PureFize[®] UV disinfection technology is free from mercury and does not involve the use of any chemicals. It has been proven very effective in combating germs with a 99.9% (log 3) reduction of *Staphylococcus aureus* in 60 seconds. Since the light sources generate relatively little heat there is no need for any thermal management, which makes it easy to integrate the technology into practically any design.

Development kits available

Are you in need of convenient and effective disinfection or consider integrating UVC into your product? We have released the first development kits for PureFize and we'll be glad to help you try out our technology. [Contact us today](#) to find out more!

We look forward to hearing from you
